Ex. No: 12	BUILD WEB APP WITH FLUTTER
Date of Exercise	29.09.2026
Git-hub Host Link	https://urk23cs1203.github.io/Flutter-Lap-Ex12og/

Aim:

To develop, run, and build a responsive Flutter application for the Web using Flutter and Chrome.

Description:

This experiment demonstrates how a Flutter allows developers to create web applications using the same Flutter framework used for mobile applications. In this experiment, a Flutter Web application is created and executed in Chrome. A responsive layout is implemented using LayoutBuilder so that the interface changes based on the browser window width. Finally, a production web build is generated using flutter build web.

Procedure:

Step 1: Check the Flutter installation and development environment using: flutter doctor

Step 2: Check the available devices and verify that Chrome or another web browser is available using: flutter devices

Step 3: Create a new Flutter web application using: flutter create flutter_web_app

Step 4: Navigate to the application directory using: cd flutter_web_app

Step 5: Open the Flutter project in VS Code using: code .

Step 6: Create the web interface in lib/main.dart using Scaffold, AppBar, and ElevatedButton.

Step 7: Implement a responsive layout using LayoutBuilder to display different layouts for mobile and desktop screen widths.

Step 8: Run the Flutter web application in Chrome using: flutter run -d chrome

Step 9: Resize the Chrome browser window and verify that the application changes between the Mobile Web Layout and Desktop Web Layout.

Step 10: Create the production web build using: flutter build web and verify that the generated files are available in the build/web/ directory

Program:

```
import 'package:flutter/material.dart';

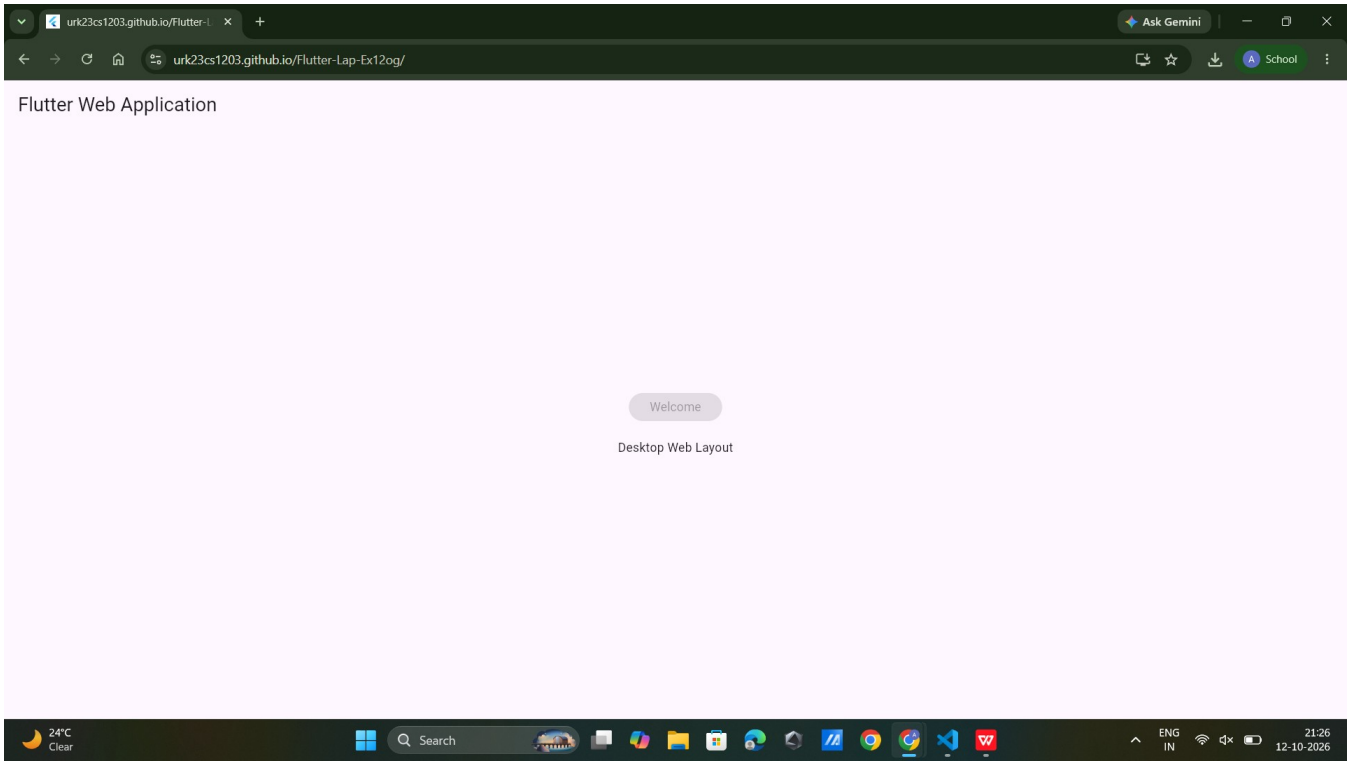

void main() {
  runApp(const MyApp());
}

class MyApp extends StatelessWidget
  { const MyApp({super.key});

  @override
  Widget build(BuildContext context)
    { return
    MaterialApp( debugShowCheckedMode
    Banner: false, title: 'Flutter Web
    Application',
      home:
       Scaffold( appBar:
       AppBar(
         title: const Text('Flutter Web Application'),
       ),
       body: LayoutBuilder(
         builder: (context, constraints) {
           if (constraints.maxWidth < 600)
             { return const Center(
               child: Text(
                 'Mobile Web Layout',
                 style: TextStyle(fontSize: 24),
               ),
             );
           }

           return const
             Center( child: Text(
               'Desktop Web Layout',
               style: TextStyle(fontSize: 30),
             ),
           );
         },
       ),
     ),
   );
  }
}
```

Output:

RESULT

A responsive Flutter Web application was successfully developed, executed in Chrome, tested with different screen sizes, and built for production.
